CAPSTONE PROJECT REPORT

SMART PURCHASE & CREDIT CARD TRACKING SYSTEM

Multi-Firm Purchase Management, Card Utilisation & Searchable Transaction Journal

PROJECT PROFILE	DETAILS
Submitted by	Lalitkumar Babubhai Sindhav (Mem. No. 196472)
Course	Artificial Intelligence Course for Chartered Accountants – Level 2
Academic context	AICA Level 2 | ICAI Gandhinagar (Batch 109)
Project type	AI-assisted software design and Python-based application prototype
Report date	November 2026
Document status	Capstone report | Based on stated requirements and described prototype

DECLARATION

I declare that this capstone report documents the business problem, requirements, design and application development work relating to the “Smart Purchase & Credit Card Tracking System.” The solution was planned with AI assistance and implemented as a Python-based local web application prototype. The report describes features, design decisions, illustrative workflows, and enhancement opportunities, and does not claim independent certification or production deployment.

Place: Ahmedabad

Date: 07/11/2026

Signature: CA. Lalit B. Sindhav

EXECUTIVE SUMMARY

Businesses trading in mobile phones and laptops frequently purchase goods from multiple offline and online vendors using credit cards belonging to proprietors, relatives and friends. When one invoice is funded by several cards and the same card is used across more than one firm, manual registers do not clearly identify the funding card and purchase utilisation. The proposed system centralises invoice entry, item-level details, card allocations and management reporting.

The application centres on two firms, a combined Credit Cardholder Master, multi-item invoices with optional IMEI/serial details, multiple card allocation per invoice, bulk master imports, administrator-controlled users and a searchable transaction journal. The Purchase Register is specifically designed to show one invoice per row, with dynamically repeated cardholder, issuer, card number and utilisation-amount columns.

The present prototype has been described as a locally hosted Windows application served by Python and accessed through a browser. A mobile-first Progressive Web App with secure cloud hosting is a proposed deployment enhancement, not an established capability of the local package.

CONTENTS

1. Introduction and Business Problem

2. Project Objectives and Scope

3. Tools and Technology Approach

4. Functional Modules and Masters

5. Purchase Invoice and Card Allocation Workflow

6. Reporting, Purchase Register and Journal Search

7. User Roles, Security and Data Controls

8. Data Model and Business Validation

9. Screen Design and User Experience

10. Implementation and Testing Approach

11. Limitations, Risks and Future Enhancements

12. Learning Outcomes and Conclusion

1. INTRODUCTION AND BUSINESS PROBLEM

The project is designed for a mobile phone and laptop trading business operating through two firms. Purchases are made during travel across India, at retail chains such as Croma and Reliance Digital and through e-commerce channels. The purchase invoice may be issued to either firm while payment is made using one or several credit cards held by different people.

In a manual process, invoice particulars, product identifiers and credit-card information may be maintained in different places. This creates delays in identifying the cardholder, card issuer, last four card digits and exact purchase value charged to each card. It also makes firm-wise and consolidated utilisation reporting difficult.

1.1 Problem statements

- Difficulty tracing one invoice to multiple credit cards and individuals.
- Difficulty consolidating a single card's purchases across two firms.
- Repeated entry of supplier, product and cardholder information.
- Missing device-level IMEI or serial numbers for multi-quantity purchase lines.
- Inconsistent report exports, particularly when multiple allocations appear in one cell or inflate invoice totals.
- Limited invoice searches across product and payment details.

2. PROJECT OBJECTIVES AND SCOPE

- Maintain purchases of two distinct firms with consolidated and firm-filtered views.
- Capture multiple items and their tax/serial details within one invoice.
- Allocate one purchase invoice across multiple cards and validate the allocated total.
- Maintain a single searchable Credit Cardholder Master.
- Provide one-row-per-invoice Purchase Registers with horizontal card-allocation column groups.
- Provide multi-field Transaction Journal search and Excel/CSV/PDF exports.
- Allow admin-created users while reserving edit/cancel and user-management privileges for administrators.
- Support straightforward bulk imports with templates, preview, duplicate checks and error summaries.

Out of scope: credit card bank statements, bill payments, settlements, reimbursements, interest, actual unpaid credit-card balances, general ledger, full inventory accounting and sales invoicing. "Card utilisation" means purchases allocated to a card in this application; it is not a bank outstanding balance.

3. TOOLS AND TECHNOLOGY APPROACH

Component	Approach / role
AI-assisted planning	Natural-language requirements analysis, workflow refinement and development assistance.
Application runtime	Python-based server with browser-delivered user interface (local Windows prototype).
Data persistence	Local application database with distinct tables for firms, users, invoices, items and allocations.
Launcher	Single-click Windows command launcher; portable Python runtime may be downloaded during first run.
Exports	Excel, CSV and PDF report formats.
Target evolution	Secure cloud-hosted, mobile-first PWA supporting home-screen installation and camera uploads.

Platform clarification: Google AI Studio and Lovable were discussed as possible development options; they are not represented here as the confirmed implementation platform for the Python prototype.

4. FUNCTIONAL MODULES AND MASTERS

Module	Functional requirements
Firm Master	Maintain firm name, GSTIN, address and active status; start with two firms and keep future expansion possible.
Vendor Master	Supplier name, GSTIN, contact details, address and searchable vendor selection.
Item Master	Descriptive names, e.g. Apple iPhone 16 (128GB, Black), brand, model, variant, HSN, GST, rate and specifications.
Credit Cardholder Master	Combined cardholder name, issuing bank and last four digits, for example Ravi HDFC CC-1234; one person may hold many cards.
Purchase Management	Multiple items, quantity/rate/tax/discount, document attachment, optional per-unit IMEI 1/IMEI 2/serial, add-item rows.
Payment Allocation	One or multiple card allocations to one invoice, each recording selected card and allocated rupee amount.
Quick Add	Create vendor, item and cardholder from the purchase form, subject to access permissions.
Administration	Admin-created logins, password change, restricted user permissions and audit trail.

4.1 Imports and searchable suggestions

Vendor, Item and Credit Cardholder Masters should accept Excel/CSV imports via downloadable sample templates. The system should preview uploads, validate required fields, detect duplicates, show row-level errors and display a success/failure summary before committing records.

Item autocomplete should first search the local product master. Online suggestions can optionally populate recognised item name, brand, model, storage, colour and specifications. Such suggestions depend on internet connectivity and third-party catalogue coverage; users must be able to correct or complete the details manually.

5. PURCHASE INVOICE AND CARD ALLOCATION WORKFLOW

- Select firm; choose or Quick Add vendor; enter date, vendor invoice number and supporting file.
- Add one or more item rows using autocomplete, quantity, rate, discount and GST treatment.
- Add optional IMEI 1, IMEI 2 or serial details for individual units where relevant.
- Calculate taxable subtotal, GST amounts and invoice total; support CGST/SGST or IGST as applicable.
- Allocate the total to one or several cards in the format “Ravi HDFC CC-1234”.
- Show amount allocated and amount unallocated; prevent allocations exceeding invoice amount.
- Save the invoice, record the author and retain cancellation/change history.

5.1 Illustrative invoice

Invoice details	Illustrative value
Firm / vendor	ABC LTD / CROMA LTD
Invoice No. / date	26-27/1 / 07 November 2026
Taxable value	Rs. 100,000
Tax	Rs. 18,000
Total invoice	Rs. 118,000

Selected card	Amount allocated
RAVI SBI CC-9898	Rs. 68,000
AMAR HDFC CC-1234	Rs. 50,000
TOTAL	Rs. 118,000

All example names and figures above are illustrative and do not represent production database transactions.

6. REPORTING, PURCHASE REGISTER AND JOURNAL SEARCH

6.1 Purchase Register — final horizontal allocation layout

The required export shows exactly one row for each invoice. Standard columns include ID, invoice date, invoice number, firm, vendor, subtotal, discount, tax, invoice total, status, card allocated and unallocated balance. Thereafter, four columns repeat for each card applied: Cardholder Name N, Card Issuer N, Card Number N and Amount Utilised N.

Invoice	Invoice Total	Cardholder Name 1	Card Issuer 1	Card Number 1	Amount Utilised 1
26-27/1	118,000	RAVI	SBI	CC-9898	68,000

Cardholder Name 2	Card Issuer 2	Card Number 2	Amount Utilised 2
AMAR	HDFC	CC-1234	50,000

The two displayed tables above represent adjacent column groups of the same single horizontal Excel/CSV record. The exported file should add groups 3, 4 and so on based on the maximum number of card allocations within the selected report set. Invoice monetary totals must not be repeated in separate allocation rows.

6.2 Transaction Journal — advanced search

A unified searchable journal should offer combined filters for financial year, date range, firm, vendor, invoice number, amount, item, brand/model/specifications, IMEI 1/IMEI 2, serial number, cardholder, issuing bank, last four card digits, payment reference, status and allocation status. Search results should link back to the relevant invoice.

For reporting accuracy, item-detail lines and card-allocation lines should be shown in distinct sections or clearly tagged row types. Joining every invoice item to every card allocation without control would multiply amounts and produce incorrect totals.

6.3 Standard report catalogue

Report	Purpose
Purchase Register	Invoice-level totals and dynamic horizontal card allocation columns.
Card Utilisation	Purchases allocated to each card, both firms combined or separately.
Cardholder Summary	Combined utilisation across all cards held by one person.
Vendor and Item Reports	Supplier trends, brand/model purchase totals and product details.
Unallocated Purchase Report	Invoices with incomplete payment allocations.

Transaction Journal	Cross-field search with export and drill-down.
Audit Report	User activities, edits, cancellations and relevant timestamps.

Excel is recommended for very wide exports; PDF reports should either use landscape formatting or a card-allocation annexure to remain readable.

7. USER ROLES, SECURITY AND DATA CONTROLS

Capability	Administrator	Regular user
View permitted firms and reports	Yes	Yes, according to access
Create purchase invoices	Yes	Yes
Create masters / Quick Add	Yes	If permitted
Edit or cancel saved transactions	Yes	No
Create users and set permissions	Yes	No
Export reports	Yes	If permitted
View audit history	Yes	No

The administrator creates users; public signup is disabled. Initial login credentials are provisioning details only and should be changed immediately. Username formats should allow sensible letters, numbers, spaces and special characters, but secure system-imposed length limits are still necessary. Passwords must be stored securely as hashes, not plain text.

Only masked card identifiers (issuer and last four digits) should be stored; do not store full card numbers, CVV or PIN. Apply server-side permission checks, database backups, access logs and safe cancellation instead of irreversible deletion.

8. DATA MODEL AND BUSINESS VALIDATION

Entity	Illustrative fields / relationship
Firm	firm_id, name, GSTIN; one firm to many invoices.
Vendor	vendor_id, name, GSTIN; one vendor to many invoices.
Item	item_id, descriptive name, model, brand, HSN and rates.
Cardholder/Card	card_id, holder_name, issuer, last_four; one holder may have many cards.
Purchase Invoice	invoice_id, firm_id, vendor_id, invoice_no, date, totals, status.
Purchase Line	line_id, invoice_id, item_id, qty, rate, tax, discount.

Device Identifiers	line/unit reference, IMEI1, IMEI2, serial and description.
Card Allocation	allocation_id, invoice_id, card_id, amount and reference.
User/Audit	user ID, role/permission, action, date/time and changed record.

- Duplicate vendor invoice warning within a firm.
- Allocation sum must not exceed invoice total; show remaining unallocated value.
- Card-wise utilisation sums allocations, not repeated invoice totals.
- Refund/cancellation adjustments must not silently erase the original audit trail.
- A card identifier must remain associated with its correct holder and issuer.
- Reports must preserve decimal precision and filter consistently across exported formats.

9. SCREEN DESIGN AND USER EXPERIENCE

The interface should favour simple forms, wide searchable tables, date/firm filters and low-click workflows. The primary navigation should contain Dashboard, Firms, Vendors, Items, Credit Cardholders, Purchases, Card Utilisation, Reports, Transaction Journal and User Administration.

The purchase screen should allow Add Another Item, Quick Add masters, file attachment and Add Another Card without discarding entered invoice details. Descriptive item search should support variants such as “Apple iPhone 16 (128GB, Black)”. The card selector should show “Ravi HDFC CC-1234” exactly as agreed.

Recommended mobile evolution: A responsive mobile-first PWA installable from Android and iPhone browsers, with touch-friendly invoice forms, camera capture and mobile optimised report viewing. This requires appropriate deployment, manifest/service-worker configuration and testing; it is not guaranteed by the current locally hosted Windows version.

10. IMPLEMENTATION AND TESTING APPROACH

Work described in the development conversation included successive local application versions with menu interaction corrections, configurable user access, purchase allocation, improved reports, item suggestions and transaction-journal search. The latest described report format moves from separate allocation rows to one row per invoice with repeated allocation columns. These are development history statements rather than an independently audited production acceptance report.

10.1 Suggested acceptance tests

Test case	Expected result
One invoice, two cards	One purchase saved; allocation sum matches invoice.
Invoice with multiple items	All item rows and optional unit serials retained.
Purchase Register export	One invoice row, separate four-column group per card.
Cross-firm card use	Same card utilisation visible firm-wise and consolidated.

Journal search for IMEI	Matching invoice/item located without duplicate financial totals.
Non-admin editing	Edit/cancellation denied on server.
Bulk import invalid rows	Validation errors shown; bad data not silently accepted.
Save and reopen	Purchase and attachments persist and remain searchable.

11. LIMITATIONS, RISKS AND FUTURE ENHANCEMENTS

11.1 Current limitations

- The described Windows prototype runs locally; cloud multi-device collaboration requires hosting and production database controls.
- Internet-based item suggestions may be partial and must be verified before saving.
- The system is a purchase-allocation tracker, not a true card-bank outstanding or repayment register.
- The wide horizontal Purchase Register may be difficult to print when an invoice uses many cards.
- Real-world tax and permission behaviour must be independently tested on representative invoices and user roles.

11.2 Future scope

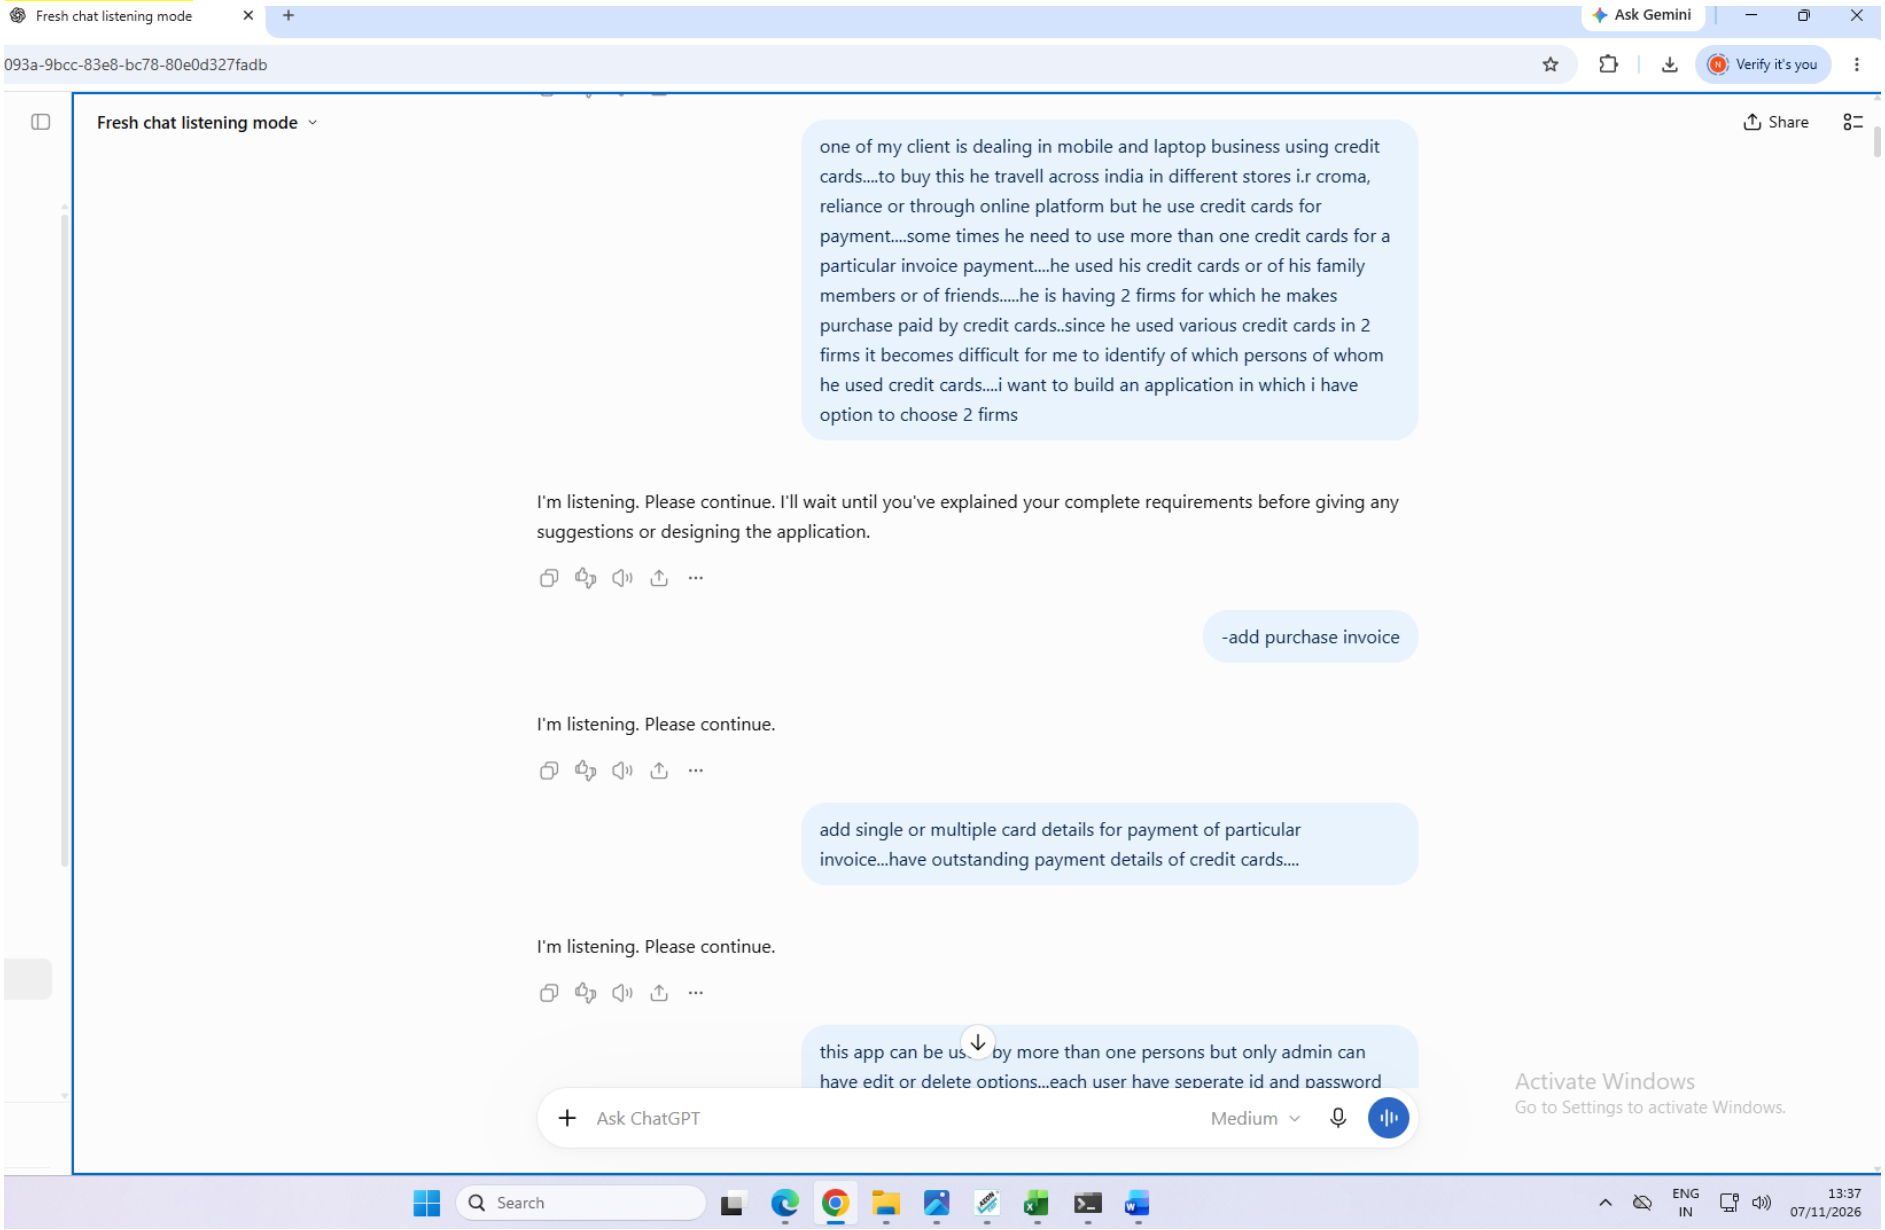

- Secure multi-user cloud deployment and mobile-first PWA.
- More reliable commercial product catalogue integration, subject to licensing and API availability.
- AI-assisted reading of invoice images and suggested product/IMEI fields with human review.
- Advanced anomaly detection for duplicate bills, unusual card use and allocation mismatches.
- Configurable import mappings, backup/restore workflows and advanced audit analytics.

12. LEARNING OUTCOMES AND CONCLUSION

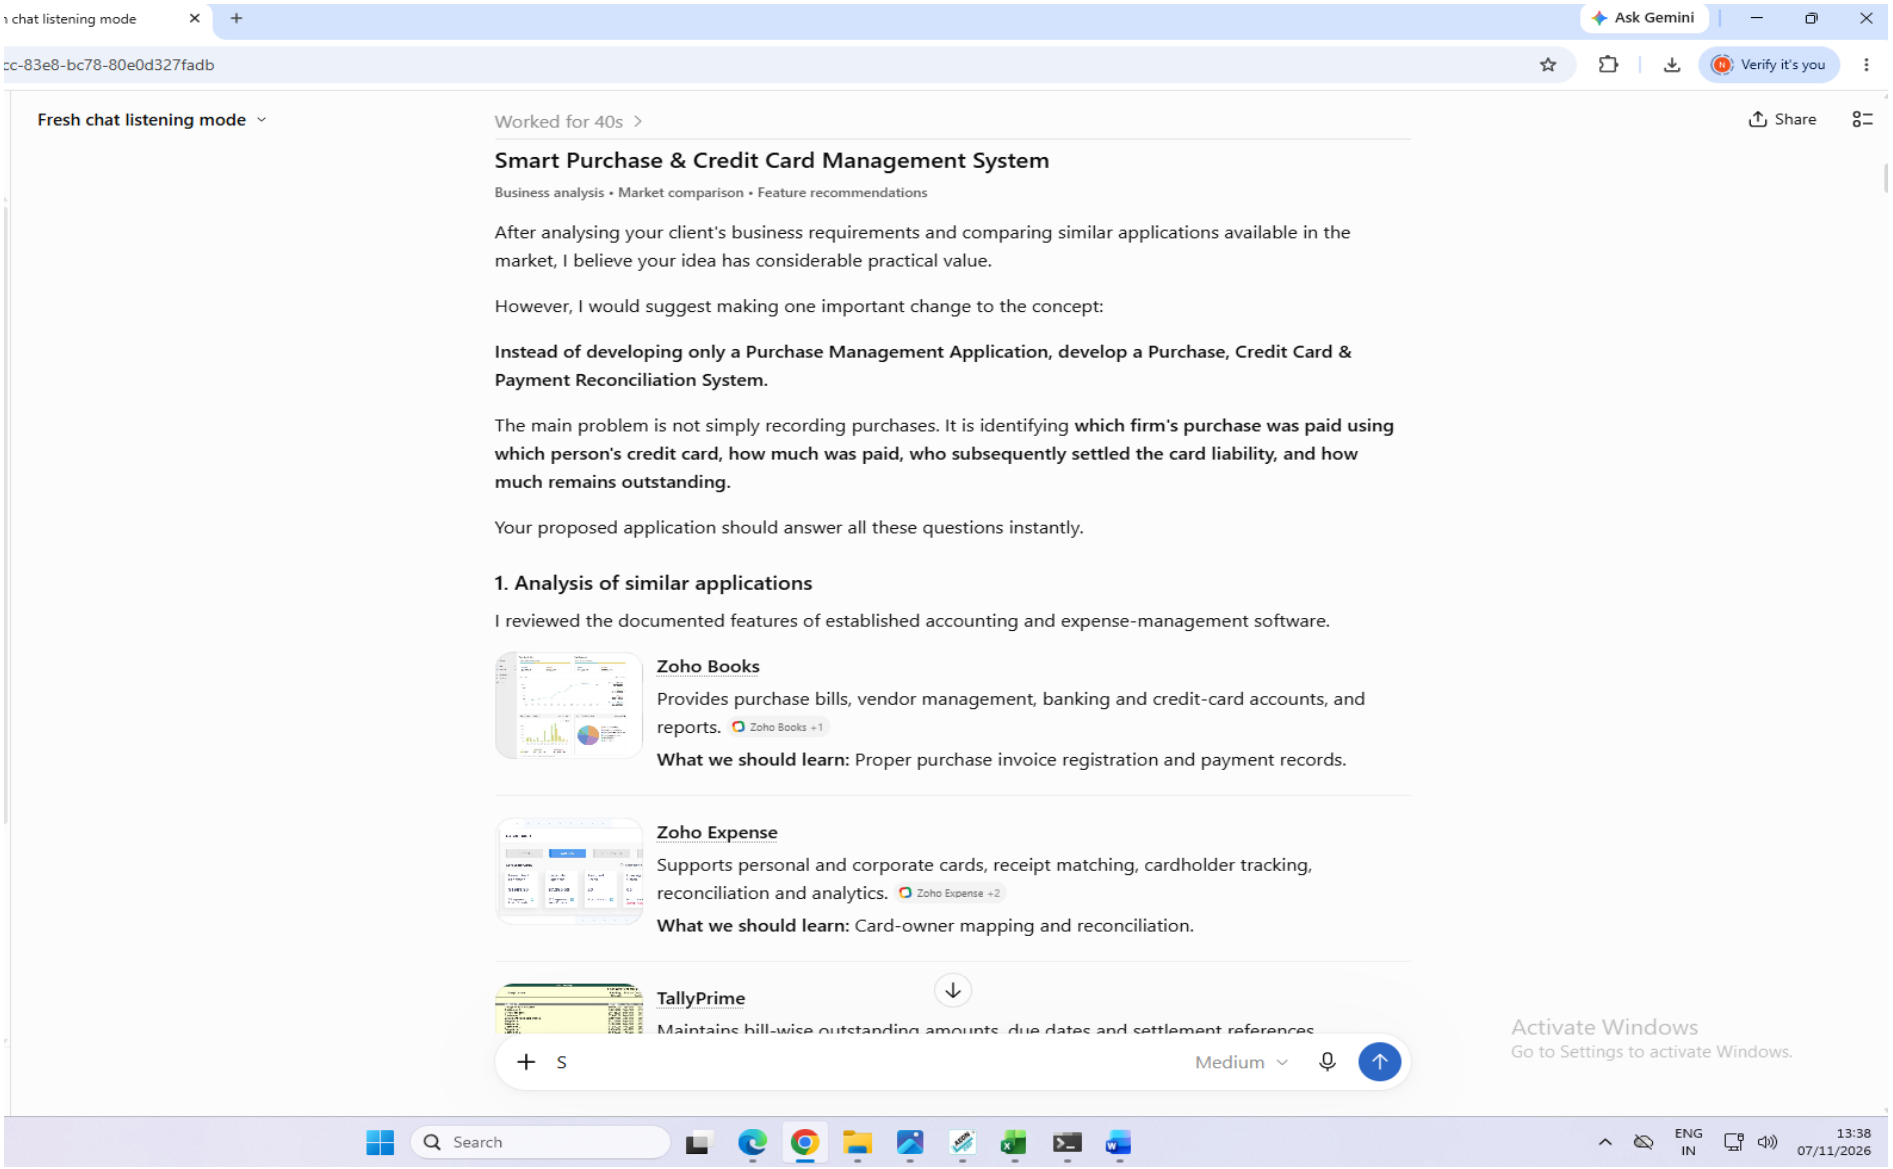

The project demonstrates conversion of a specific accounting and operational problem into clear software requirements, structured data entities, purchase allocation rules, permission policies and actionable reports. It also demonstrates the need for careful report design: one invoice may have multiple products and multiple payment cards, and incorrect table joins can inflate reported transactions.

The Smart Purchase & Credit Card Tracking System provides a focused approach to identifying the exact payment cards used for purchases across multiple firms. The distinguishing report requirement is a one-row-per-invoice Purchase Register that horizontally expands card allocation fields without losing underlying transaction details. The project remains intentionally narrower than a full accounting or credit-card settlement platform, supporting practical adoption and phased enhancement.

one of my client is dealing in mobile and laptop business using credit cards....to buy this he travell across india in different stores i.r croma, reliance or through online platform but he use credit cards for payment....some times he need to use more than one credit cards for a particular invoice payment....he used his credit cards or of his family members or of friends.....he is having 2 firms for which he makes purchase paid by credit cards..since he used various credit cards in 2 firms it becomes difficult for me to identify of which persons of whom he used credit cards....i want to build an application in which i have option to choose 2 firms
I'm listening. Please continue. I'll wait until you've explained your complete requirements before giving any suggestions or designing the application.
-add purchase invoice
I'm listening. Please continue.
add single or multiple card details for payment of particular invoice...have outstanding payment details of credit cards....
I'm listening. Please continue.
this app can be us by more than one persons but only admin can have edit or delete options...each user have seperate id and password

Response to Prompt No. 1

as paying one invoice through several credit cards.

My finding

These applications already solve many individual problems. However, based on the documented features reviewed, I did not verify a standard workflow that directly combines all of your requirements:

- Two separate purchasing firms.
- Several credit cards belonging to the proprietor, relatives and friends.
- One invoice paid through multiple cards.
- A single card used for purchases across both firms.
- Tracking both card-bill payments and reimbursements to cardholders.

This is the specific gap your application should address. It does not mean existing software cannot be customised for it.

2. The most important feature: Multiple credit cards against one invoice

Consider this example:

Activate Windows
Go to Settings to activate Windows.

The application should automatically verify that the total amount allocated to credit cards, bank payments or other payment methods does not exceed the invoice amount.

It should also allow partially paid invoices.

This is one of the most important features of your entire project.

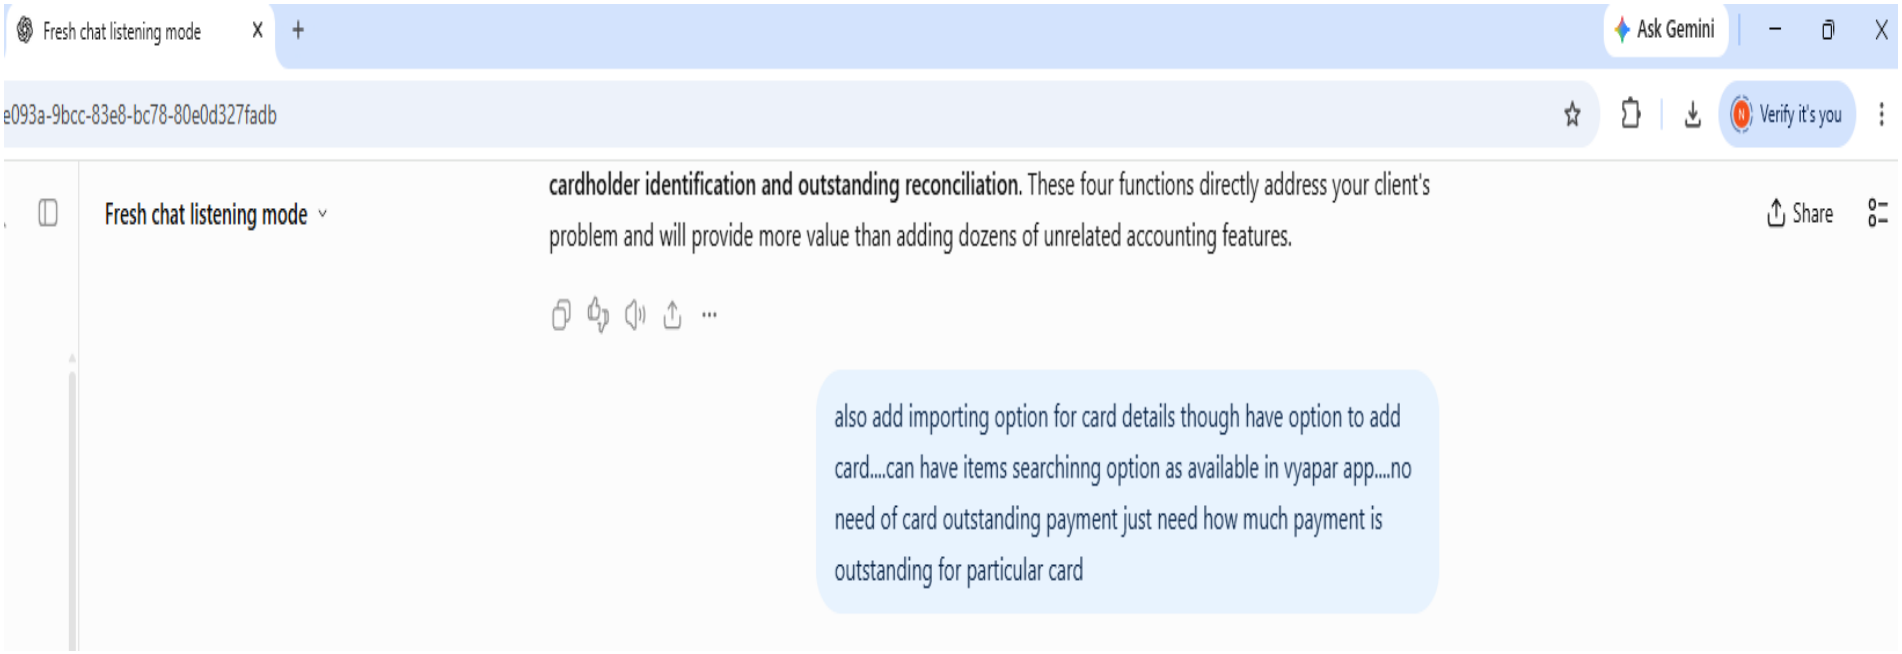

3. Features I strongly recommend adding

Your existing requirements are a good foundation. I suggest the following additional features, arranged by importance.

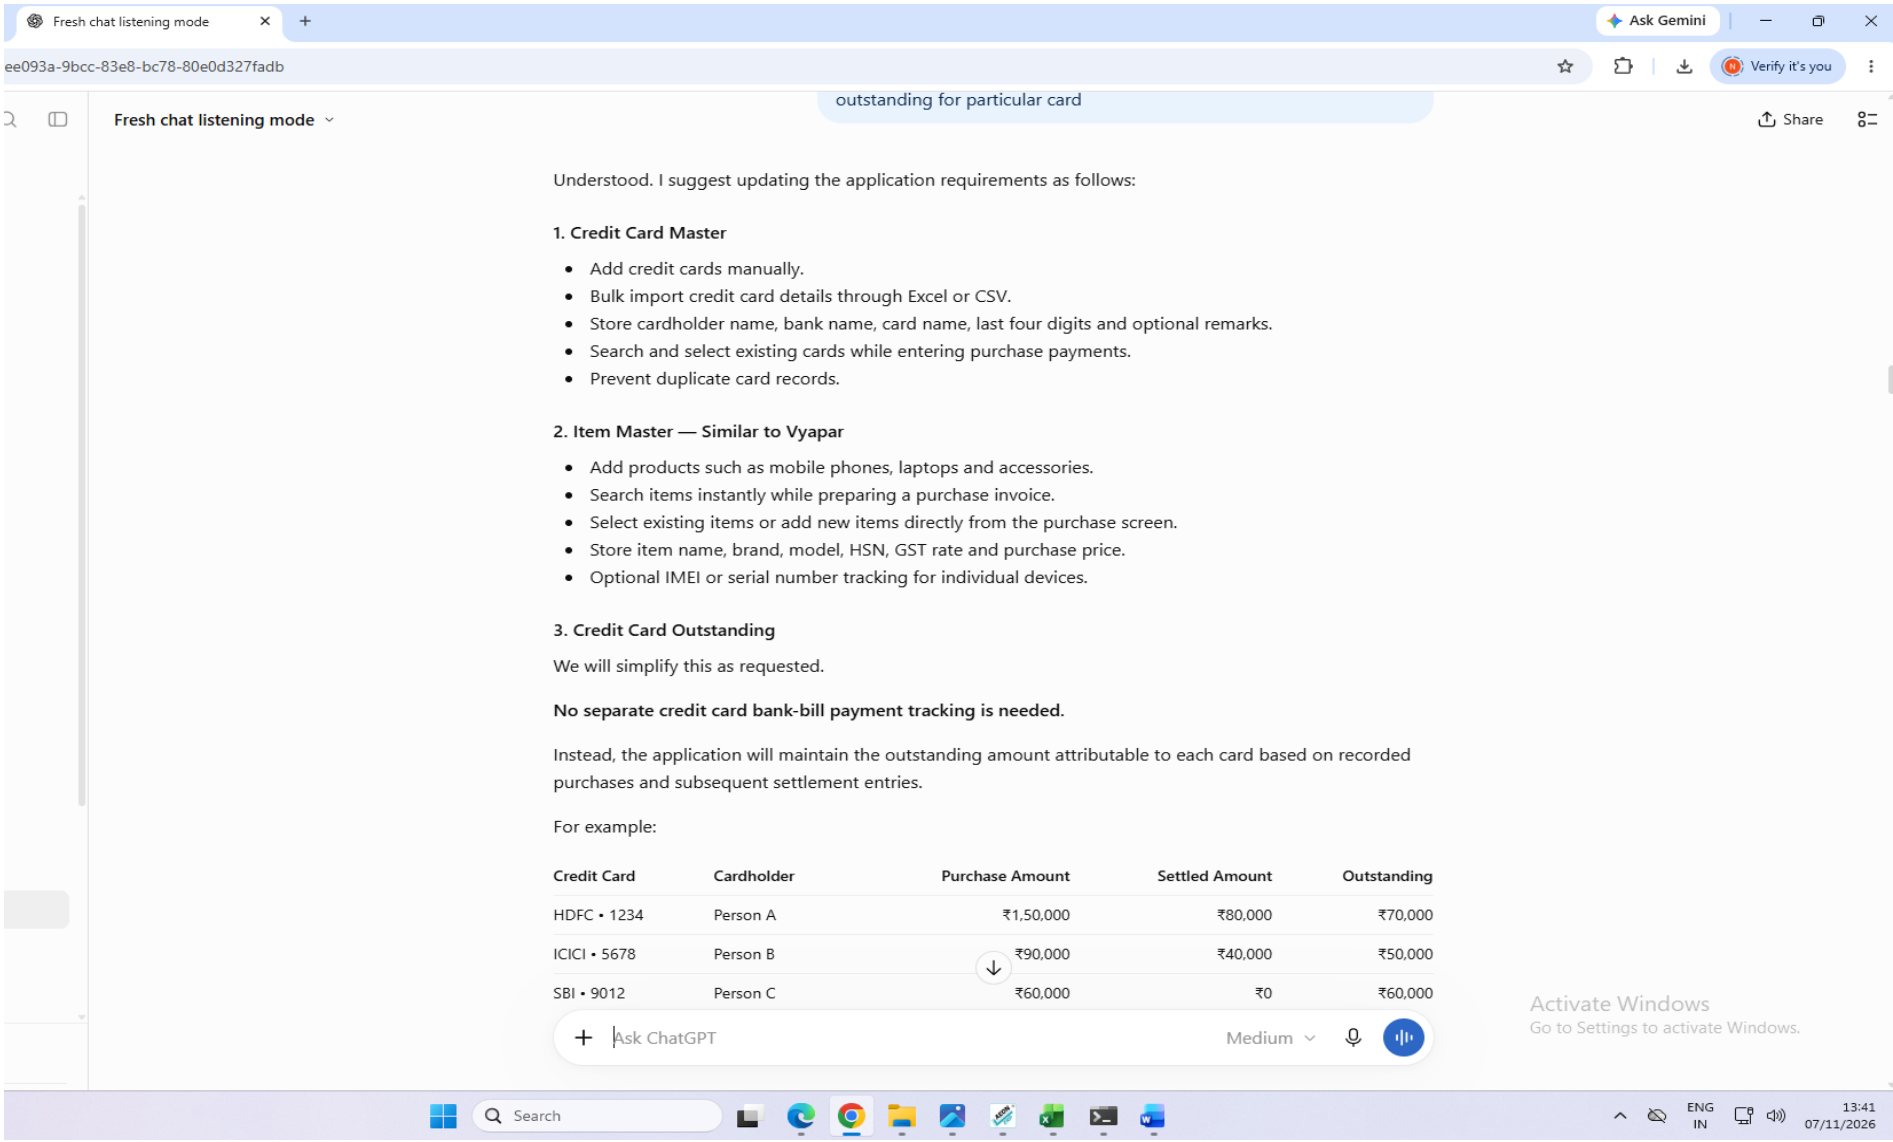

Feature	Why it matters	Priority
Firm-wise dashboard	Separate and consolidated view of both firms	Essential
Credit card master	Store cardholder, bank, last 4 digits and billing details	Essential
Multiple-card payment	Allocate any invoice across several cards	Essential
Card outstanding ledger	Track purchases, refunds and bill payments	Essential
Cardholder-wise ledger	Identify money paid by each family member or friend	Essential
Card settlement entry	Record payments made against card bills	Essential
Invoice attachment	Upload invoice PDF or photograph	Essential
Payment proof	Attach card transaction or payment confirmation	Essential
Refunds and cancellations	Reverse or adjust returned purchases correctly	Essential
Due-date reminders	Monitor card payment deadlines	Recommended
Duplicate invoice detection	Avoid repeated purchase entries	Recommended
Excel, CSV and PDF reports	Export records for checking and accounting	Essential
Audit history	Record who added or changed information	Essential
Credit card statement import	Match imported transa s against recorded purchases	Future
Invoice OCR	Extract bill details automatically	Future

cardholder identification and outstanding reconciliation. These four functions directly address your client's problem and will provide more value than adding dozens of unrelated accounting features.
Share
also add importing option for card details though have option to add card....can have items searchinng option as available in vyapar app....no need of card outstanding payment just need how much payment is outstanding for particular card
